

Comparison of rare-cell identification methods across 6 datasets (mean $\pm$ SD, 3 seeds, rts=all)

† HiCat is transductive (PCA/UMAP/DBSCAN fit on combined train+test; threshold from test clusters) — shown as a transductive upper-bound reference, not an inductive baseline.
Only scRareRefine constrains false-rescue rate $\leq \alpha=0.01$; other methods' FFR is uncontrolled (see rare_fp_rate in comparison_summary.csv).
